

Reducing processing cost with DeltaMax through cycle time reduction

CUSTOMER NEED : A horticultural container manufacturer is attempting to increase throughput and reduce processing costs of their 2.65 gallon flower pots.

CURRENT SITUATION

When attempting to increase the throughput of current equipment and materials, parts become defective. Commercially available higher melt flow resins often produce brittle parts that break easily. Conversely, lower melt flow resins may lead to product defects, such as short shots and inconsistent parts.

Manufacturer remains firm on the importance of high impact properties in their polypropylene resin and therefore sources a less desired, lower melt flow resin in order to meet physical properties. This in turn limits the overall ability to increase manufacturing speeds.

Increasing processing speed of current low melt flow PP resin results in a short shot.

RESULTS

Using DeltaMax m100 Melt Flow Modifier at 0.5% loading, allowed our customer to reduce processing temperatures by 14%, resulting in shorter cooling times and a cycle time reduction of 13%. Throughput improvements of 415,000 pots results in \$275,000 of additional revenue with significant margin improvement.

MILLIKEN SOLUTION

DeltaMax m100 Melt Flow Modifier allows converters to boost melt flow and impact of impact copolymer PP in injection molding applications.
